IMAGE EVALUATION
TEST TARGET (MT-3)

6"
The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

- Coloured covers/ Couverture de couleur
- Covers damaged/ Couverture endommagée
- Covers restored and/or laminated/ Couverture restaurée et/ou pelliculée
- Cover title missing/ Le titre de couverture manque
- Coloured maps/ Cartes géographiques en couleur
- Coloured ink (i.e. other than blue or black)/ Encre de couleur (i.e. autre que bleue ou noire)
- Coloured plates and/or illustrations/ Planches et/ou illustrations en couleur
- Bound with other material/ Relié avec d'autres documents
- Tight binding may cause shadows or distortion along interior margin/ La reliure serrée peut causer de l'ombre ou de la distortion le long de la marge intérieure
- Blank leaves added during restoration may appear within the text. Whenever possible, these have been omitted from filming/ Il se peut que certaines pages blanches ajoutées lors d'une restauration apparaissent dans le texte, mais, lorsque cela était possible, ces pages n'ont pas été filmées.

Additional comments:/ Commentaires supplémentaires:

This item is filmed at the reduction ratio checked below/ Ce document est filmé au taux de réduction indiqué ci-dessous.

The copy filmed here has been reproduced thanks to the generosity of:

Legislative Library of
British Columbia

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Legislative Library of
British Columbia

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

```
1 2 3
```

The last recorded frame on each microfiche shall contain the symbol —— (meaning "CONTINUED"), or the symbol ▼ (meaning "END"), whichever applies.

The Fauna of the Sooke Beds of Vancouver Island.

By

John C. Merriam.

With One Plate.

Issued March 6, 1899.

SAN FRANCISCO:
Published by the Academy.
1899.
THE FAUNA OF THE SOOKE BEDS OF VANCOUVER ISLAND.

BY JOHN C. MERRIAM.

The Sooke beds, so named from their occurrence in the Sooke district, on the southern coast of Vancouver Island, have been principally studied in the field by Dr. C. F. Newcombe of Victoria, B. C., the fossil invertebrates collected by him being placed at the disposal of the writer for study and description. As the result of the investigation of this material, together with that from other horizons, the author has, during the past two years, published two diagnostic notes on this fauna.

As no figures of the new species have been published, and as investigation of this fauna is not easily combined with any other to which the writer is at present giving particular attention, it was thought best to bring together in one note the principal facts known regarding the fauna, furnishing also figures of the new species. Future investigation will probably add many new forms to the list given in this paper.

The first mention of the Sooke beds made in the literature is by Mr. James Richardson, who in 1876 noticed the occurrence of fossiliferous rocks in the Sooke district. The following extract from his paper expresses his opinion of the beds:

"At the mouth of John's River the lowest beds are gray sandstone, in some places crowded with fossils belonging

March 4, 1899.
apparently to three or four species. These are referable to the genera *Ostrea, Pecten,* and *Saxidomus,* and are either of Tertiary or Post-Tertiary age."

In 1892 Dr. W. H. Dall\(^1\) mentioned the occurrence of marine beds of Miocene age near Sooke.

Dr. Newcombe has, in 1893–98, made numerous visits to the outcroppings of the beds near Mujr and Coal Creeks, bringing back a considerable amount of material in a very good state of preservation.

The cliffs in which the fossils occur are said by Dr. Newcombe to consist of soft sandstone and conglomerate. The strata do not appear to be greatly disturbed. Molluscan remains are found in abundance in both the sandstone and the conglomerate. In most instances the specimens are well preserved, showing the original unchanged material of the shell.

The number of known species being small, it is perhaps not possible to determine with absolute accuracy the age of this horizon. The recent and extinct species are, however, about evenly divided, so that both the Quaternary and the Eocene are beyond the range of possibility. Within the limits of the Neocene the nearly equal number of extinct and living forms points to Middle Neocene, while the general relationships of the fauna to the known Miocene and Pliocene faunas of the coast show no preponderance of affinity in either direction. The total evidence available seems then to indicate the Middle Neocene age of the Sooke fauna.

1 Referring to the fauna described by Conrad from Astoria and identified by the writer at Carmanah Point, Vancouver Isl. See Br. Dept Geol., Univ. Cal., Vol. II, No. 3, p. 102.
The following species which have previously been diagnosed by the writer are here redescribed and figured:

Genus *Cytherea* Lamarck.

*Cytherea* (?) *Newcombei* Merriam.

**Plate XXIII, Figs. 1 and 1a.**

Shell subquadrate to oval, high, moderately thick, truncated anteriorly. Beaks not prominent. Lunula faintly marked. Surface ornamented with numerous, irregularly placed growth lines and ridges. On some well preserved specimens a large number of very faint, radial lines are visible. Length of large specimens 70 mm., breadth 55 mm. Hinge of right valve with three cardinal teeth and a short pit for the anterior lateral tooth of the opposite valve. This pit for the reception of the anterior lateral tooth is shallower and much shorter than in the following species.

*Cytherea Vancouverensis* Merriam.

**Plate XXIII, Fig. 2.**

Shell oval, narrowly rounded anteriorly. Beaks prominent. Lunule well marked. The somewhat weathered surface of the shells ornamented by numerous, irregularly-placed growth ridges. Length of type specimen 62 (?) mm., breadth 48 mm. Hinge of right valve with three cardinal teeth and a long, deep tooth-pit for the reception of the anterior lateral tooth of the left valve. Pit between the two anterior cardinal teeth of the right valve ordinarily narrower and deeper than in *C. Newcombei*.

Genus *Patella* Linné.

*Patella geometrica* Merriam.

**Plate XXIII, Fig. 4.**

Shell large and heavy, up to 50 mm. or more in length, suborbicular. Apex elevated, well forward. Surface ornamented by about twenty broad, strong, radial ribs, which are much wider than the interspaces. Radial ribs crossed by numerous prominent, narrow, sometimes leafy, transverse ridges.
Genus Nassa Martini.

Nassa Newcombei Merriam.

PLATE XXIII, FIG. 3.

Shell between 25 and 30 mm. in length. Whorls five, with a well marked shoulder, ornamented by numerous longitudinal and transverse ribs which give the middle portion of the whorls a tessellated appearance. The upper revolving rib, which forms the angle of the shoulder, is stronger than the others and is usually separated from them by a distinct groove. On the last whorl the transverse ribs (about 25) are dominant on the upper portion, excepting the shoulder, and are latticed by the less conspicuous revolving sculpture. On the lower portion of the whorl the transverse ribs disappear leaving the well defined revolving ribs uninterrupted.

Genus Bullia Gray.

Bullia buccinoides Merriam.

PLATE XXIII, FIG. 5.

Shell ovate, whorls five. Spire short. Suture partially or entirely covered. Aperture with strong anterior notch. Outer lip thin, sharp; inner lip with broad callus. Length 25-30 mm.
